Web Developer

I'm a web developer, with an HND level diploma, obtained following an intensive one year face to face course at The Simplon School in France. During that year I learned HTML, CSS, Bootstrap, Javascript, Node JS, PHP, Laravel (MVC principles), SQL, Database conception (UML), Agile methodologies, Git, all in a Linux environment (Ubuntu) and obtained an Opquast certification. Following which I completed a three month internship where I worked on a plugin and a component for the CMS Joomla!. Since graduating, I have completed several independent projects to keep developing my skills and learned new technologies such as React JS, Tailwind and Wordpress.

What I'm looking for:

- A human sized company
- Learning and improving my skills
- Work ethics
- New challenges
- Mentoring

What I offer you:

- Team player
- Eagerness to learn
- Maturity
- Adaptability
- Humility

Experience

FlexiContent plugin, Com3elles, Internship

I was responsible for adding a functionality to an existing Joomla plugin. My task required implementing the possibility of choosing between the existing Google map interface and another package consisting of Openstreet map for the data, Leaflet for the map itself and Algolia for the search suggestions and field autocompletions. This confronted me with legacy code, which consisted of an entanglement of php variables in Javascript code in PHP files. I successfully implemented the package and merged the fields in order to have only one display.

K2toFlexi component, Com3elles, Internship

Having rapidly completed my initial job I joined another intern on his task. Which involved a component used to migrate a website content created with a CCK (Content Construction Kit) to another CCK format. This was essentially a form conversion process. We had to be sure every field, every option, every content type could be converted. As I joined an ongoing project it required me to understand what everything was meant to do, what my colleague had done and what was left to do. A challenge we faced was that a file containing 4000 lines did not work. Through an intense collaboration we succeeded in getting the component to work. Finally I then translated it, user and admin interfaces, from French to English to increase chances of adoption by the Joomla community.
